

# Host Ports used by Hypernode setup (Docker Compose)

Analyzed sources:

- installer\_docker/composes/database/docker-compose.yaml
- installer\_docker/composes/server/docker-compose.yaml

Ports published on the host (host:container binding):

- DB\_PORT (default 27017) -> 27017/tcp [MongoDB]
- 5672 -> 5672/tcp [RabbitMQ]
- 5500 -> 5500/tcp [Export service]
- 8181 -> 80/tcp [Webserver]
- SSL\_PORT (default 443) -> 443/tcp [Portbroker/HTTPS]

Summary of host ports to reserve (defaults):

443, 5500, 5672, 8181, 27017

Important note:

- camera and metadata use network\_mode: host.
- With host networking there is no Docker NAT: any ports listened to inside these containers are opened directly on the host.
- These additional ports cannot be determined with certainty from compose only.
